|---------------------------------|

INTRODUCTION

The 2015-16 National Family Health Survey (NFHS-4), the fourth in the NFHS series, provides information on population, health, and nutrition for India and each state and union territory. For the first time, NFHS-4 provides district-level estimates for many important indicators. All four NFHS surveys have been conducted under the stewardship of the Ministry of Health and Family Welfare (MoHFW), Government of India. MoHFW designated the International Institute for Population Sciences (IIPS), Mumbai, as the nodal agency for the surveys. Funding for NFHS-4 was provided by the United States Agency for International Development (USAID), the United Kingdom Department for International Development (DFID), the Bill and Melinda Gates Foundation (BMGF), UNICEF, UNFPA, the MacArthur Foundation, and the Government of India. Technical assistance for NFHS-4 was provided by ICF, Maryland, USA. Assistance for the HIV component of the survey was provided by the National AIDS Control Organization (NACO) and the National AIDS Research Institute (NARI), Pune.

Four survey questionnaires – household, woman's, man's, and biomarker--were used to collect information in 19 languages using Computer Assisted Personal Interviewing (CAPI). All women age 15-49 and men age 15-54 in the selected sample households were eligible for interviewing. In the household questionnaire, basic information was collected on all usual members of the household and visitors who stayed in the household the previous night, as well as socioeconomic characteristics of the household, water and sanitation, health insurance, and number of deaths in the household in the three years preceding the survey. Two versions of the woman's questionnaire were used in NFHS-4. The first version (district module), which collected information on women's characteristics, marriage, fertility, contraception, reproductive health, children's immunizations, and treatment of childhood illnesses, was fielded in the entire sample of NFHS-4 households. Information on these topics is available at the district, state, and national levels. In the second version of the questionnaire (state module), four additional topics, namely, sexual behaviour, HIV/AIDS, husband's background and women's work, and domestic violence, were also included. This version was fielded in a subsample of NFHS-4 households designed to provide information only at the state and national levels. The man's questionnaire covered the man's characteristics, marriage, number of children, contraception, fertility preferences, nutrition, sexual behaviour, attitudes towards gender roles, HIV/AIDS, and lifestyle. The biomarker questionnaire covered measurements of height, weight, and haemoglobin levels for children; height, weight, haemoglobin, blood pressure, and random blood glucose for women age 15-49 years and men age 15-54 years, and the collection of finger-stick blood for HIV testing in a laboratory. Questionnaire information and biomarkers were collected only with informed consent from the respondents.

The NFHS-4 sample was designed to provide estimates of all key indicators at the national and state levels, as well as estimates for most key indicators at the district level (for all 640 districts in India, as of the 2011 Census). The total sample size of approximately 572,000 households for India was based on the size needed to produce reliable indicator estimates for each district and for urban and rural areas in districts in which the urban population accounted for 30-70 percent of the total district population. The rural sample was selected through a two-stage sample design with villages as the Primary Sampling Units (PSUs) at the first stage (selected with

probability proportional to size), followed by a random selection of 22 households in each PSU at the second stage. In urban areas, there was also a two-stage sample design with Census Enumeration Blocks (CEB) selected at the first stage and a random selection of 22 households in each CEB at the second stage. At the second stage in both urban and rural areas, households were selected after conducting a complete mapping and household listing operation in the selected first-stage units.

The figures of NFHS-4 and that of earlier rounds may not be strictly comparable due to differences in sample size and NFHS-4 will be a benchmark for future surveys. NFHS-4 fieldwork for Chhattisgarh was conducted in all 18 districts of the state from 22 January to 22 June 2016 by the Indian Institute of Health Management Research (IIHMR University) and collected information from 20,275 households, 25,172 women age 15-49 (including 4,078 women interviewed in PSUs in the state module), and 3,827 men age 15-54.

This report presents the key findings of the NFHS-4 survey in, Chhattisgarh followed by detailed tables and an appendix on sampling errors. At the time of finalization of this report, wealth quintiles for the country as a whole were not ready. Therefore, on finalization of the national report, the breakup of key indicators by wealth quintiles for all states will be provided as an additional document and uploaded on the official website of MoHFW and IIPS.

HOUSEHOLD CHARACTERISTICS

Household composition

About one-fourth of Chhattisgarh's households (24%) are in urban areas. On average, households in Chhattisgarh are comprised of just under 5 members. Thirteen percent of households are headed by women, with 10 percent of the population living in female-headed households.

The vast majority of households in Chhattisgarh have household heads who are Hindu (95%). About 2 percent of households each have household heads who are Muslim and Christian.

About one-third (31%) of households in Chhattisgarh have household heads who belong to a scheduled tribe, 46 percent belong to an other backward class (OBC), and about one-seventh (14%) belong to a scheduled caste. One-twelfth (8%) of Chhattisgarh's household heads do not belong to scheduled castes, scheduled tribes, or other backward classes.

Twenty-nine percent of Chhattisgarh's population is under age 15; only 6 percent is age 65 and over. The overall sex ratio of the population is 1,019 females per 1,000 males, and the sex ratio of the population under seven years of age is lower (977 females per 1,000 males). Ninety-one percent of persons have an *Aadhaar* card.

Among children below 18 years of age, 5 percent have experienced the death of one or both parents. In all, 87 percent of children below 18 years of age live with both parents, 7 percent live with one parent (mostly with their mother), and the remaining 5 percent live with neither parent. Births of almost all children under five years of age (86%) were registered with the civil authorities, and 71 percent of children have a birth certificate.

Housing characteristics

A little over one-third of households in Chhattisgarh (36%) live in a *pucca* house and almost all households (96%) have electricity. Almost three-fifths (59%) of households do not use a sanitation facility, which means that household members practice open defecation, a substantial improvement from 81 percent at the time of NFHS-3. Open defecation is much more common among rural households (72%) than urban households (18%).

Only one-fifth of households in Chhattisgarh have water piped into their dwelling, yard, or plot.

Ninety-one percent of households use an improved source of drinking water, but only 20 percent have water piped into their dwelling, yard, or plot. Urban households (53%) are more likely than rural households (9%) to have water piped into their dwelling, yard or plot. Fourteen percent of households treat their drinking water appropriately to make it potable (mostly by boiling the water). Less than one-fourth (23%) of households use a clean fuel for cooking.

Selected household possessions

A large majority of urban and rural households (93% and 75%, respectively) in Chhattisgarh have a mobile phone. Ninety-three percent of households have a bank or post office account. BPL cards are held by more than three-fourths of households (78%), up substantially from 30 percent in NFHS-3. Agricultural land is owned by 66 percent of rural households and 21 percent of urban households. Overall, more than half of all households in Chhattisgarh own agricultural land.

EDUCATION

School attendance among children

Eighty-seven percent of children age 6-17 years in Chhattisgarh attend school (90% in urban areas and 86% in rural areas). School attendance is almost universal (94%) at age 6-14 years and then drops to 73 percent at ages 15-17. There is no gender disparity in school attendance.

Are there gender differentials in children's school attendance? Percentage of children attending school by age

Literacy, educational attainment, and media exposure

In NFHS-4, literate persons are those who have either completed at least standard six or passed a simple literacy test conducted as part of the survey. According to this measure, 66 percent of women age 15-49 and 86 percent of men age 15-49 are literate.

Only 17 percent of women age 15-49 in Chhattisgarh have completed 12 or more years of schooling, compared with 24 percent of men.

Twenty-eight percent of women and 11 percent of men age 15-49 have never been to school. Only 17 percent of women age 15-49 in Chhattisgarh have completed 12 or more years of schooling, compared with 24 percent of men. Media exposure is high among women and men in Chhattisgarh. About 8 in 10 women and men watch television at least once a week. However, men (43%) are much more likely than women (19%) to read a newspaper or magazine at least once a week. Only 15 percent of men and 20 percent of women are not regularly exposed to print media or other forms of media.

FERTILITY

Age at first marriage

The median age at first marriage is 18.6 years among women age 20-49 years and 22.4 years among men age 25-49 years. On average, men get married about four years later than women. Twenty-one percent of women age 20-24 years got married before the legal minimum age of 18, down from 55 percent in NFHS-3. About one-fourth of men (27%) age 25-29 years got married before the legal minimum age of 21, down from almost half (45%) of men in NFHS-3.

Fertility levels

The total fertility rate (TFR) in Chhattisgarh is 2.2 children per woman, implying that the state is very close to reaching replacement level fertility. Fertility decreased by 0.2 children in the 7 years between NFHS-2 and NFHS-3, and has declined further by 0.4 children in the 10 years between NFHS-3 and NFHS-4.

Fertility in urban areas, at 1.8 children per woman, is well below replacement level and is close to replacement level even in rural areas (2.4 children per woman). Among births in the three years preceding the survey, 12 percent were of birth order four or higher, compared with 28 percent in NFHS-3.

The greatest differentials in fertility are by schooling, caste/tribe, and religion. At current fertility rates, women with no schooling will have 0.9 children more than women who had 12 or more years of schooling (a TFR of 2.7, compared with 1.8). Similarly, Christian women will have an average of about 0.3 children more than Muslim women (a TFR of 2.4, compared with 2.1).

How does fertility vary with schooling? Total fertility rate (children per woman)

Pregnancy outcome

Ninety-one percent of last pregnancies in the five years preceding the survey ended in a live birth, and the remaining 9 percent terminated in foetal wastage (abortion, miscarriage, or stillbirth). Miscarriage is the most commonly reported type of foetal wastage, accounting for 5 percent of all pregnancies, and abortions accounted for 2 percent. A majority of the abortions were performed at home (45%) and 35 percent were performed in the private health sector. Almost one-fourth of women reporting an abortion reported having complications from the abortion.

Teenage pregnancy

Among young women age 15-19 in Chhattisgarh, 5 percent have already begun childbearing, that is, they have already had a live birth or are pregnant with their first child, down from 15 percent in NFHS-3. Less than one percent of women age 15-16 years have started childbearing, but this proportion increases sharply to 6 percent among women who are 18 years old and to 17 percent among women who are 19 years old. Young women who had no schooling or less than five years of schooling are more than five times as likely to have begun childbearing as young women with 12 or more years of schooling.

Birth intervals

The median interval between births in the five years before the survey in Chhattisgarh is 32.5 months, a half month shorter than in NFHS-3. Eight percent of births take place within 18 months of the last birth and 24 percent occur within 24 months. Almost three-fifths (58%) of births occur within three years of the previous birth. Research shows that waiting at least three years between children reduces the risk of infant mortality.

Almost three-fifths (58%) of births in Chhattisgarh occur within three years of the previous birth.

Fertility preferences

Seventy percent of currently married women and almost the same proportion of currently married men (69%) want no more children, are already sterilized, or have a spouse who is sterilized. Among those who want another child, a little more than half of women and men would like to wait at least two years before the next birth. Sixty-eight percent of women and 73 percent of men consider the ideal family size to be two or fewer children.

In Chhattisgarh there is a strong preference for sons. Twenty percent of women and 18 percent of men want more sons than daughters, but only 4 percent each of women and men want more daughters than sons. However, most men and women would like to have at least one son and at least one daughter.

Women's desire for more children is strongly affected by their current number of sons. For example, among women with two children, 92 percent with two sons and 87 percent with one son want no more children, compared with only 53 percent with two daughters who want no more children. However, the proportion of currently married women with two children who want no more children irrespective of their number of sons has increased to 83 percent in the 10 years since NFHS-3 (75%).

Current family size

In Chhattisgarh, unplanned pregnancies are relatively common. If all women were to have only the number of children they wanted, the total fertility rate would have been cosiderably below replacement level, at 1.9 children per woman, instead of the current level of 2.2 children per woman.

FAMILY PLANNING

Contraceptive knowledge and use

Knowledge of contraception is almost universal in Chhattisgarh. However, some methods are still less well known. A little less than three-fourths (74%) of currently married women know about injectables and 12 percent know about female condoms. Among all women, 41 percent know about emergency contraception.

The contraceptive prevalence rate (CPR) among currently married women age 15-49 is 58 percent, which is a slight increase from NFHS-3 (53%). Modern method use, at 55 percent, is also little more than its level in NFHS-3 (49%). In share of Chhattisgarh, the female sterilization in contraceptive method use has remained unchanged at 77-80 percent in the three most recent NFHS surveys. Contraceptive use in NFHS-4 increases sharply with age from 9 percent for women age 15-19 to 74 percent for women age 40-49.

In Chhattisgarh, contraceptive use is higher in urban areas (62%) than in rural areas (56%). Contraceptive prevalence is lower (50%) among women with 10 years How many women use family planning? Percentage of currently married women

or more schooling than among women with lesser number of years of schooling; moreover, more than half of currently married women with no schooling use female sterilization, compared with 25 percent of women with 12 or more years of schooling. Christian women (43%) are much less likely to use contraception than Hindu (58%) and Muslim women (55%). Women in Chhattisgarh are much more likely to use contraception if they already have a son. For example, among women with two children, 72 percent with at least one son use a method of family planning, compared with 39 percent of women with two daughters and no sons.

The most common modern spacing methods used by currently married women in Chhattisgarh are condoms/*Nirodhs* (4%), pills and IUD or PPIUD (2% each). In general, urban women and better-educated women are more likely than other women to use spacing methods.

Ninety-three percent of sterilized women had their sterilization operation in a public sector health facility, mainly in a CHC/rural hospital/ Block PHC or a camp, and 79 percent of IUD or PPIUD users had their IUD insertion in a public sector health facility.

The majority of pill and condom/ *Nirodh* users get their supply from the private medical sector or other source, including a shop. Nonetheless, 39 percent of pill users and 21 percent of condom users get their supply from the public medical sector.

What contraceptive methods do women use? Currently married women

The 12-month discontinuation rate for all methods is 32 percent. Fifty-two percent of users of modern spacing methods discontinued use within the first year after they adopted the method. The most common reason for discontinuation is the desire to become pregnant.

Almost one-third of contraceptive users discontinue use within the first year after they adopt the method.

Informed choice

Women who know about all available contraceptive methods and their side effects can make better choices about what method to use. Only 66 percent of users of selected modern contraceptive methods were ever told by a health or family planning worker about other methods they could use. Only 55 percent were told about the possible side effects or problems with their method, and even fewer (47%) were told what to do if they experienced any side effects.

Men's attitudes

Thirty-four percent men age 15-49 in Chhattisgarh agree that contraception is women's business and a man should not have to worry about it. However, 22 percent think that women using contraception may become promiscuous. A majority of men (60%) know that a condom, if used correctly, protects against pregnancy most of the time.

Contraceptive Prevalence Rate by District *Percentage of currently married women*

Unmet need

Unmet need for family planning is defined as the percentage of currently married women who either want to space their next birth or stop childbearing entirely, but are not using contraception. According to this definition, 11 percent of currently married women have an unmet need for family planning, unchanged since NFHS-3. Currently, 84 percent of the demand for family planning is being satisfied and 79 percent of the demand is being satisfied by modern methods. The percentage of demand for family planning that is satisfied has not changed since NFHS-3.

INFANT AND CHILD MORTALITY

The infant mortality rate in Chhattisgarh in NFHS-4 is estimated at 54 deaths before the age of one year per 1,000 live births, down from the NFHS-3 estimate of 71 and the NFHS-2 estimate of 81.

As expected, boys have a higher mortality rate than girls during the neonatal period (in the first month of life). During the postneonatal period (ages 1-11 months) girls have a slightly higher mortality rate than boys. Infant mortality and child mortality are higher among boys than girls.

Trends in Infant Mortality *Deaths per 1,000 live births*

Children born to mothers under age 20 and age 30-39 are more likely to die during infancy than children born to mothers in the prime childbearing age (20-29 years). Infant mortality is 67 per 1,000 live births for teenage mothers and 57 for mothers age 30-39, compared with 51 for mothers age 20-29. Having children too close together is especially risky. Children born less than two years after a previous birth are more likely to die in infancy than children whose mothers waited four or more years between births. Infant mortality is 75 per 1,000 live births for children born less than two years after a previous birth are previous birth compared to 43 per 1,000 live births for children born four years or more after a previous birth.

Infant mortality rates are also higher for scheduled tribes and other backward classes than for those who are not from scheduled castes, scheduled tribes, or other backward classes.

All five early childhood mortality rates are higher in rural areas than in urban areas. The infant mortality rate is much higher for children whose mothers have no schooling (74 per 1,000 live births) than for children whose mothers have completed 10 or more years of schooling (33 per 1,000 live births).

Note: Category "Mother's age at birth 40-49" not shown since there are fewer than 250 unweighted person-years of exposure to the risk of death

Children born less than two years after a previous birth are more likely to die in infancy than children whose mothers waited four or more years between births.

MATERNALHEALTH

Antenatal care

Among mothers who gave birth in the five years preceding the survey, 91 percent received antenatal care (ANC) for their last birth from a health professional (44% from a doctor and 47% from an auxiliary nurse midwife (ANM), lady health visitor (LHV), nurse, or midwife). Four percent did not receive any antenatal care. Among mothers who gave birth in the five years preceding the survey, almost all (94%) registered the pregnancy for the most recent live birth. Among the registered pregnancies, 91 percent received a Mother and Child Protection Card (MCP Card).

Seventy-one percent of women received antenatal care during the first trimester of pregnancy, recommended. is About as three-fifths of mothers (59%) had four or more antenatal care visits; urban women were more likely to receive four or more antenatal visits than rural women. The proportion of women who received four or more antenatal care visits and the proportion of women who had their first antenatal care visit in the first trimester of pregnancy for their last births have both increased substantially in the 10 years since NFHS-3. For 91 percent of their last births, mothers received iron and folic acid (IFA) supplements, but only 30 percent consumed them for the recommended 100

days or more. More than 90 percent of last births (94%) were protected against neonatal tetanus through tetanus toxoid vaccinations given to the mother. Twenty-three percent of mothers took an intestinal parasite drug during pregnancy.

About three-fifths of mothers in Chhattisgarh received at least four antenatal care visits for their last birth.

Among women with a live birth in the five years preceding the survey who met with a community health worker in the last three months of pregnancy for their most recent live birth, at least three-fourths received advice on each of the five different areas (91% received advice on breastfeeding, 90% on the importance of institutional delivery, 85% on keeping the baby warm, 81% on cord care and 79% on family planning).

Even when women receive antenatal care, sometimes they do not receive all the services needed to monitor their pregnancy. In Chhattisgarh, about 90 percent of women or more who received antenatal care for their last birth received each of the services needed to monitor their pregnancy: having their weight taken (98%), having their blood pressure measured (94%), having urine and blood samples taken (89% each), and having their abdomen examined (91%).

An ultrasound test was performed during 51 percent of pregnancies in the five years preceding the survey. Women with at least 12 years of schooling were much more likely to have an ultrasound test than women with no schooling. Eighty percent of women with at least 12 years of schooling had an ultrasound test compared with 31 percent of women with no schooling. Pregnant women with no sons are more likely to have an ultrasound test than those with at least one son. For example, among women with two children, 41 percent of those with no sons had an ultrasound test, compared with 37 percent of those with at least one son.

Delivery care

Seventy percent of births take place in a health facility (mostly a government facility) and 30 percent take place at home. The percentage of births in a health facility increased five times in the 10 years between NFHS-3 and NFHS-4, from 14 percent in NFHS-3 to 70 percent in NFHS-4. Institutional births are more common among women who have received an antenatal check, women with 12 or more years of schooling, women who are having their first birth, and Muslim women.

For 99 percent of home births, a clean blade was used to cut the cord, as is recommended. A disposable delivery

Are babies being delivered safely? Percentage of births in the past five years

kit was used for 58 percent of deliveries. Ninety percent of home births followed the recommendation that the baby be immediately wiped dry and then wrapped without being bathed first.

Seventy-eight percent of births during the past five years took place with assistance from a skilled provider, and another 18 percent were delivered by a traditional birth attendant.

Ten percent of births during the past five years were delivered by caesarean section. Half of caesarean sections (5% of all births) were emergency caesarean sections.

Among women who had a live birth in the five years preceding the survey that was delivered in a health facility, 66 percent received financial assistance under the *Janani Suraksha Yojana* (JSY). Rural women were much more likely than urban women to receive financial assistance under JSY. Scheduled tribe women were more likely than any other caste/tribe group of women to receive financial assistance under JSY.

Institutional Delivery by District

Seventy percent of children in Chhattisgarh who were born in the last five years were born in a health facility.

Postnatal care

Early postnatal care for a mother helps safeguard her health and can reduce maternal mortality. In Chhattisgarh, 75 percent of mothers had a postnatal check after their last birth and 69 percent of mothers had a postnatal check within two days of the birth, as is recommended. Postnatal care is most common following births in a medical facility; More than three-fourths (78%) of births in a public health facilities and 88 percent of births in a private health facilities were followed by a postnatal check for the mother within two days of birth, compared with only two-fifths of home births.

Only 39 percent of last births in the five years preceding the survey received a health check in the first two days after birth. About 30 percent of home births received a health check in the first two days after birth.

Male involvement in maternal care

Ninety-one percent of men with a child under three years of age said that the youngest child's mother received antenatal care. More than three-fourths of men (77%) with a child under three years said they were present during at least one antenatal check received by the child's mother (89% in urban areas and 73% in rural areas), but only 59 percent were told by a health provider or health worker what to do if the mother had a pregnancy complication. Only 46-65 percent of men were told about the signs of specific pregnancy complications (vaginal bleeding, convulsions, high blood pressure, prolonged labour, and severe abdominal pain).

More than 7 out of 10 fathers with a child less than three years of age (70-79%) were given information about various aspects of maternal care. Seventy-nine percent were told about the importance of proper nutrition for the mother during pregnancy and 76 percent were told

about the importance of delivering the baby in a health facility. Seventy percent were told by a health provider or a health worker about family planning or delaying the next child. Only 50-61 percent of fathers whose child was not delivered in a health facility were told about the importance of cord care, the importance of keeping the baby warm immediately after birth, and the importance of breastfeeding the baby immediately after delivery.

CHILD HEALTH

Vaccination of children

More than three-fourths (76%) of children age 12-23 months received all basic vaccinations against six major childhood illnesses (tuberculosis, diphtheria, pertussis, tetanus, polio, and measles) at any time before the survey. However, almost all children are at least partially vaccinated; only 1 percent has not received any vaccinations at all.

Ninety-eight percent of children have received a BCG vaccination. However, fewer children have received other basic vaccinations (82% have received at least the recommended three doses of polio vaccine, 91% have received the three recommended doses of DPT vaccine, and 94% have been vaccinated against measles). There is considerable dropout between the first and third doses of polio vaccine (from 98% to 82%) and somewhat less for DPT vaccine (from 98% to 91%).

Trends in Vaccination Coverage

Between NFHS-3 and NFHS-4, there is a considerable increase in vaccination coverage for three doses of DPT (from 63% to 91%), measles (from 63% to 94%), and BCG (from 85% to 98%), but coverage for three doses of polio vaccine declined from 85 percent to 82 percent. Overall, there was a sizable increase in the coverage of all basic vaccinations (from 49% to 76%). In addition, 92 percent of children have received at least one dose of hepatitis B vaccine and just over three-fourths of children (76%) have received all three recommended doses of hepatitis B vaccine.

Coverage of All Basic Vaccinations by District *Percentage of children 12-23 months*

Coverage with all basic vacinations is higher in urban areas than in rural areas (85% vs. 74%) and is highest for children whose mothers have 10 or more years of schooling and for first births. There is not much difference in vaccination coverage by caste/tribe or the sex of the child.

Coverage with all basic vaccinations is highest for children whose mothers have 10 or more years of schooling.

Childhood illnesses

In the two weeks before the survey, 2 percent of children under age five years had symptoms of an acute respiratory infection (cough accompanied by (1) short, rapid breathing that is chest relate and/or (2) difficult breathing that is chest related). Of these children, 78 percent were taken to a health facility or health provider.

Thirteen percent of children under age five were reported to have had fever in the two weeks preceding the survey; 70 percent of these children were taken to a health facility or provider for treatment.

Overall, 9 percent of children under age five years had diarrhoea in the two weeks preceding the survey. Seventy-one percent of these children were taken to a health facility or health provider. Almost all (96%) mothers of young children have heard of oral rehydration salt (ORS) packets for the treatment of diarrhoea, but only 68 percent of children with diarrhoea were

given ORS. Forty-one percent of children with diarrhoea were given gruel and three-fourths (74%) were given some type of oral rehydration therapy (ORT). Twenty-nine percent were given zinc supplements. Twelve percent of children with diarrhoea did not receive any type of treatment at all.

To reduce dehydration and minimise the effects of diarrhoea on nutritional status, it is recommended that normal feeding of children be continued when they have diarrhoea and that the amount of fluids given should be increased. However, in Chhattisgarh only 4 percent of children with diarrhoea received more to drink than normal. About two-fifths of children (38%) received the same amount to drink as usual. Of greater concern, almost three-fifths of children with diarrhoea (58%) were given less to drink or nothing at all to drink. Only 32 percent of children with diarrhoea were given the same amount of food or more food, as recommended. More than half of children with diarrhoea (54%) were given ORT and continued feeding.

Integrated Child Development Services (ICDS)

The ICDS programme provides nutrition and health services for children under age six years and pregnant or breastfeeding women, as well as preschool activities for children age 3-5 years. These services are provided through community-based *anganwadi* centres.

More than three-fourths of children under 6 years (77%) receive services of some kind from an anganwadi centre. The most common services that age-eligible children receive are growth monitoring (77%), supplementary food (72%), health check-ups (68%), and immunizations (63%). The service that is least likely to be accessed is early childhood care or preschool (55% of children age 3-6 years). About three-fourths of the mothers of

children who were weighed at an *anganwadi* centre (73%) received counseling from an *anganwadi* worker or an ANM. Among children under 6 years, 89 percent of their mothers received any service from an *anganwadi* centre during pregnancy, and 87 percent of their mothers received any service while breastfeeding.

BREASTFEEDING, NUTRITION, AND ANAEMIA

Infant feeding

Although breastfeeding is nearly universal in Chhattisgarh, only 77 percent of children under 6 months are exclusively breastfed, as the World Health Organization (WHO) recommends. Ninety percent are put to the breast within the first day of life, but only 47 percent started breastfeeding in the first hour of life (as recommended). While the initiation of breastfeeding indicators show substantial improvement since NFHS-3, many infants are still deprived of the highly nutritious first milk (colostrum) and the antibodies it contains.

It is recommended that nothing be given to children other than breastmilk even in the first three days when the milk has not begun to flow regularly because prelacteal feeds limit the frequency of suckling by the infant and expose the baby to the risk of infection. However, 9 percent of children are given something other than breastmilk during the first three days. Overall, 97 percent of children continue breastfeeding at 1 year and 88 percent continue breastfeeding at 2 years. The median duration of breastfeeding is 36.0 or more months, which is the age to which half of children are breastfeed.

After the first 6 months, breastmilk is no longer enough to meet the nutritional needs of infants. Therefore, complementary foods should be added to the diet of the child. However, at age 6-8 months only 54 percent of children in Chhattisgarh receive breastmilk and complementary foods.

WHO has several recommendations for infant and young child feeding (IYCF) practices for children age 6-23 months. The key IYCF indicators measure the adequacy of dietary diversity and meal frequency for breastfed and nonbreastfed children. Only about three-fifths of children ages 6-23 months (56%) are fed the recommended minimum number of times per day and even fewer (19%) are fed from the appropriate number of food groups. Only 11 percent are fed according to all three recommended practices.

Micronutrient deficiency is a major contributor to childhood morbidity and mortality. Vitamin A is an essential nutrient for the immune system. Severe vitamin A deficiency (VAD) can cause eye damage and a higher risk of dying from measles and diarrhoeal disease. The Government of India recommends that children under 5 years of age receive vitamin A supplements every six months, starting at age 9 months. In Chhattisgarh, 71 percent of children age 9-59 months were given a vitamin A supplement in the past six months, and 71 percent of children age 9-23 months ate vitamin A-rich foods during the day or night before the survey.

Iron deficiency is a primary cause of anaemia. Eating foods rich in iron and taking iron supplements can help prevent anaemia. Only 16 percent of children age 9-23 months ate iron-rich foods during the day or night before the survey, but 36 percent of children age 6-59 months were given iron supplements in the week before the survey.

Children's nutritional status

Nearly two-fifths (38%) of children under age five years in Chhattisgarh are stunted, or too short for their age, which indicates that they have been undernourished for some time. Twenty-three percent of under-five children are wasted, or too thin for their height, which may result from inadequate recent food intake or a recent illness causing weight loss, and 8 percent are severely wasted. Close to two-fifths (38%) of children under age five years are underweight, which takes into account both chronic and acute undernutrition. Three percent of children are overweight. Even during the first six months of life, when almost all babies are breastfed, 32 percent of children are underweight, and 30 percent are wasted.

Children's nutritional status in Chhattisgarh has improved since NFHS-3 by some measures, but not by all measures. Stunting decreased from 53 percent to 38 percent in the vears between NFHS-3 and 10 NFHS-4, and the percentage of children who are underweight decreased from 47 percent to 38 percent. However, in the same period, wasting increased slightly (from 20% to 23%). Despite the gains in stunting and underweight, child malnutrition is still a major problem in Chhattisgarh.

Note: Nutritional status estimates are based on the 2006 WHO International Reference Population

Boys are slightly more likely to be malnourished than girls, and children in rural areas are more likely to be malnourished than those in urban areas. Undernutrition generally decreases as mother's schooling increases. Mothers who are underweight are much more likely to have children who are stunted, wasted, and underweight than mothers who are overweight. The level of undernutrition is relatively high for scheduled tribe children and children of higher birth orders.

Adults' nutritional status

Thirty-nine percent of women and 34 percent of men are either too thin or overweight or obese. Twenty-seven percent of women and 24 percent of men in Chhattisgarh are too thin, and 12 percent of women and 10 percent of men are overweight or obese. About three-fifths of women and two-thirds of men are at a healthy weight for their height.

Undernutrition is particularly common in the younger age groups, in rural areas, and among those belonging to scheduled tribes and other backward classes. Overweight and obesity are most prevalent in older adults, those in urban areas, those with at least 12 years of schooling,

and those who are not in a scheduled caste, a scheduled tribe, or other backward class. Because population groups that are less likely to be too thin are the same groups that are more likely to be overweight or obese, the percentage suffering from either of these two nutritional problems is fairly constant across all groups, regardless of their educational attainment, caste, age, residence, or marital status.

The use of iodized salt prevents iodine deficiency, which can lead to miscarriage, goitre, and mental retardation. Almost all of Chhattisgarh's households (99%) were using iodized salt at the time of the survey, up from 79 percent in NFHS-3.

Anaemia

Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Iron deficiency is estimated to be responsible for about half of all anaemia globally, but anaemia can also be caused by malaria, hookworm and other helminths, other nutritional deficiencies, chronic infections, and genetic conditions. Anaemia can result in maternal mortality, weakness, diminished physical and mental capacity, increased morbidity from infectious dis-

eases, perinatal mortality, premature delivery, low birth weight, and (in children) impaired cognitive performance, motor development, and scholastic achievement. Anaemia is a major health problem in Chhattisgarh, especially among women and children.

Among children between the ages of 6 and 59 months, just over two-fifths of children (42%) are anaemic. This includes 24 percent who are mildly anaemic, 17 percent who are moderately anaemic, and 1 percent who suffer from severe anaemia. Younger children (age 6-23 months) are twice as likely to be anaemic as children age 48-59 months.

Children of mothers who have anaemia are much more likely to be anaemic. Although anaemia levels vary somewhat according to background characteristics, anaemia among children is widespread in every group. More than one-third of children (36%) are anaemic even if their mother has 12 or more years of schooling.

Almost half of women age 15-49 (47%) in Chhattisgarh have anaemia, including 38 percent with mild anaemia, 8 percent with moderate anaemia, and 1 percent with severe anaemia. Anaemia is particularly high (52 percent or more) for women who are breastfeeding, women with no schooling (52%), women who are widowed, divorced, separated, or deserted and scheduled tribe women. More than one-fifth of men (22%) are anaemic. The highest prevalence of anaemia among men is for scheduled tribe men, men with no schooling, men age 15-19, and men age 40-49.

Adult Health And Health Care

Tuberculosis

In Chhattisgarh, 157 persons per 100,000 are estimated to have medically treated tuberculosis, based on reports from household respondents. The prevalence of medically treated tuberculosis is higher among men (205) than among women (110) and is higher in rural areas (168) than in urban areas (121).

Most respondents have heard of tuberculosis (92% of women and 96% of men), but even among those who have heard of tuberculosis, only 63 percent of women and 73 percent of men know that it is spread through the air by coughing or sneezing. Fifty-seven percent of women and more than two-thirds (67%) of men have misconceptions about how tuberculosis is spread. Overall, 89 percent of women and 95 percent of men know that tuberculosis can be cured, and only 10 percent of women and 9 percent of men say that if a family member had tuberculosis, they would want to keep it a secret.

Diabetes, asthma, goitre, heart disease, and cancer

According to self-reports, 548 women age 15-49 and 769 men age 15-49 per 100,000 have diabetes. Overall, 862 women and 442 men per 100,000 suffer from asthma. The prevalence of asthma is higher among older women and men, those who have no schooling, and those in urban areas. Goitre or any other thyroid disorder is somewhat more common than asthma among women (1,261 cases per 100,000 women), but less common among men (132 cases per 100,000). The prevalence of any heart disease is higher among women (582 per 100,000) than men (458 per 100,000). Among the five diseases, cancer is the least common, with 91 women per 100,000 and 27 men per 100,000 reportedly suffering from cancer.

Blood pressure (hypertension)

Ten percent of women age 15-49 in Chhattisgarh have hypertension, including 7 percent with Stage 1 hypertension, and 1 percent each with Stage 2 and Stage 3 hypertension. Slightly more than three-fifths (61%) of women have normal blood pressure and about 1 percent of them are taking medicine to lower their blood pressure. The prevalence of hypertension among men age 15-49 is somewhat higher than in women. Thirteen percent of men in Chhattisgarh have hypertension, including 10 percent with Stage 1 hypertension, 2 percent with Stage 2 hypertension, and 1 percent with Stage 3 hypertension. For both women and men, hypertension increases with age.

Blood glucose

NFHS-4 included measurement of random blood glucose among women age 15-49 and men age 15-54. Three percent of women age 15-49 in Chhattisgarh have high blood glucose levels, and an additional 3 percent have very high blood glucose levels. In comparison, 10 percent of men age 15-49 have high or very high blood glucose levels. Older women and men have relatively high blood glucose levels.

Health examinations

In Chhattisgarh, 18 percent of women have ever undergone an examination of the cervix, only 7 percent have ever undergone a breast examination, and only 8 percent have ever undergone an examination of the oral cavity.

Tobacco and alcohol use

Twenty-two percent of women and 55 percent of men age 15-49 use some form of tobacco. Men are much more likely to use *gutkha* or *paan masala* with tobacco (28%) than to use other types of tobacco. Among both women and men, the use of any form of tobacco is higher in rural areas than in urban areas. Most men who smoke cigarettes or *bidis* smoked 5 or fewer cigarettes or *bidis* in the past 24 hours. More than half of the men age 15-49 drink alcohol (53%), compared with only 5 percent of women. Among men who drink alcohol, 43 percent drink alcohol at least once a week.

Source of health care

The public medical sector is the main source of health care for half of households. However, more urban households (60%) reported the private health sector as a main source of health care. Household members are more likely to go to private doctors or clinics (32%) than any other specific public or private source of health care.

Health insurance

With the emergence of a number of health insurance programmes and health schemes, 69 percent of households in Chhattisgarh have some kind of health insurance that covers at least one member of the household. Health insurance coverage is somewhat less common in urban areas (59%) than rural areas (71%). In Chhattisgarh, two programmes dominate: the *Rashtriya Swasthya Bima Yojana* (RSBY), and the State health insurance scheme.

Two-thirds of women and men age 15-49 years in Chhattisgarh are covered by any health scheme or health insurance. More women and men residing in rural areas than in urban areas are covered by any health scheme or health insurance.

HIV/AIDS

Awareness of HIV or AIDS

Over 81 percent of women in Chhattisgarh have heard of HIV or AIDS. In urban areas, 93 percent know about HIV or AIDS, compared with 77 percent in rural areas. Older women age 40-49 years are less likely (74%) than young women age 15-24 (85%) to have heard of HIV or AIDS. Women having no schooling (63%) and women with no mass media exposure (59%) are less likely than other women to have heard of AIDS.

Men are much more likely than women to know about HIV or AIDS. Almost all men (92%) in Chhattisgarh have heard of HIV or AIDS, including 97 percent in urban areas and 99 percent of those with at least 12 years of schooling.

Knowledge of prevention and transmission

Men are much more likely than women to know how HIV is transmitted and how to keep from getting it. For example, only 58 percent of women know that consistent condom use can help prevent HIV/AIDS, compared with 83 percent of men, and 61 percent of women know that having just one uninfected partner who has no other partners can reduce the chance of getting HIV/AIDS, compared with 81 percent of men.

Only 21 percent of women and 36 percent of men in Chhattisgarh have a 'comprehensive knowledge' about HIV/AIDS. This means they know that consistent use of condoms every time they have sex and having just one uninfected sex partner who has no other partners can reduce the chance of getting HIV/AIDS, they know that a healthy-looking person can have HIV/AIDS, and they reject two common misconceptions about transmission or prevention of HIV/AIDS.

HIV-related stigma

Eighty-two percent of women and 87 percent of men in Chhattisgarh who have heard of HIV/AIDS would be willing to take care of a relative with HIV/AIDS in their home. A similar proportion of women (81%), but only about three-fourths of men (77%) say that a female teacher who has HIV/AIDS but is not sick should be allowed to continue teaching. Three-fourths of adults say that they would buy fresh vegetables from a shopkeeper with HIV/AIDS. Sixty-three percent of women and 76 percent of men say that if a family member got infected with HIV/AIDS, they would not want to keep it a secret.

HIV testing prior to NFHS-4, blood transfusions, and safe injections

Only 10 percent of women and 6 percent of men age 15-49 had ever been tested for HIV prior to NFHS-4. Women (19%) and men (10%) living in urban areas are somewhat more likely to have ever been tested for HIV prior to NFHS-4 than rural women and men. Fifteen percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

Fifteen percent of women who had a live birth in the past five years and received ANC during pregnancy were tested for HIV during ANC.

In Chhattisgarh, women (6%) are about as likely as men (5%) to have ever had a blood transfusion. Women are more likely than men to have received an injection in the past 12 months (64% of women, compared with 53% of men).

For more than 90 percent of adults who received an injection in the past 12 months, a disposable syringe was used.

SEXUAL BEHAVIOUR

NFHS-4 included questions on respondents' sexual behaviour. Respondents were asked about their age at first sex, their current and previous sexual partners, higher-risk intercourse and condom use. In addition, men were asked whether they had paid for sex in the past year. These questions are sensitive and subject to reporting bias, so the results should be interpreted with caution.

Higher-risk behaviour

Higher-risk sex is sexual intercourse with someone who is neither a spouse nor a cohabiting partner. Among those who had sex in the past 12 months, only 2 percent of women and 11 percent of men reported having had higher-risk sex during the past 12 months. The percentage of men who had higher-risk sexual intercourse in the past 12 months differs slightly by residence (13% in urban areas and 10% in rural areas). Even fewer respondents said that they had multiple sex partners in the past 12 months (0.2% of women and 2% of men).

About half of men (47%) who had higher-risk sex in the past 12 months reported using a condom the last time they had higher-risk sex, with no difference between men in rural and urban areas.

Only 1 percent of men said they had paid for sex in the past year. Fifty-seven percent of the men who paid for sexual intercourse in the past 12 months used a condom the last time they paid for sexual intercourse.

WOMEN'S EMPOWERMENT

Women's hygiene

Using a hygienic method of menstrual protection is important for women's health and personal hygiene. In NFHS-4, young women age 15-24 were asked what method or methods they use for menstrual protection, if anything. In Chhattisgarh, 34 percent use sanitary napkins, 81 percent use cloth, 10 percent use locally prepared napkins, and 4 percent use tampons. Overall, 47 percent of women in this age group use a hygienic method of menstrual protection. Women with at least 10 years of schooling are more than six times as likely to be using a hygienic method as women with no schooling. Notably, only 46 percent of Hindu women use a hygienic method of menstrual protection, compared with 73 percent of Muslim women. Rural (39%) women and scheduled tribe (35%) women are less likely to use hygienic methods than their counterparts.

Employment and earnings

Only 45 percent of all women age 15-49 were employed in the 12 months preceding the survey; in the same period, 82 percent of all men age 15-49 were employed. Among employed women, 82 percent earned cash, including 9 percent whose earnings were in both cash and in-kind, and 13 percent were not paid at all. Most men who were employed earned cash (95%) and only 4 percent were not paid at all. Fifty percent of employed women worked in non-agricultural occupations, compared with 68 percent of employed men.

Only 45 percent of all women age 15-49 were employed in the 12 months preceding the survey.

Among currently married women who work and are paid in cash, 85 percent of them decide how their earnings will be used, either alone or jointly with their husbands. Over two-fifths (42%) of women who work for cash say that they earn more or about the same as their husbands. In contrast, 88 percent of currently married men who have wives who have cash earnings report that they alone or jointly with their wives decide how her earnings are used and 53 percent of men who have cash earnings and whose wives have cash earnings say that their wife earns more or about the same as them.

Decision making

Currently married women were asked who makes decisions about their own health care, major household purchases, and visits to their own family or relatives. Women are equally likely to participate in decisions about their own health care, decisions about major household purchases, and decisions about visits to their own family and relatives (79% each). Overall, 66 percent of currently married women participate in making all three of these decisions, and 10 percent do not participate in making any of the three decisions. Participation in all three decisions varies most by age, increasing from 61 percent among women age 20-24 to 72 percent among women age 40-49.

Currently married men were also asked who makes decisions about their own health care and major household purchases. Men were much more likely than women to report that they alone or jointly with their wife participated in both these decisions: 95 percent each participated in making decisions about their own health care and decisions about major household purchases.

Other indicators of women's empowerment

Forty-four percent of women have some money that they can decide how to use. The proportion of women with money which they control is higher among urban than rural women, increases with age, and is highest among women with 12 or more years of schooling (55%) and Muslim women (54%).

Just over half of women (51%) have a bank or savings account that they themselves use.

Just over half of women (51%) have a bank or savings account that they themselves use. This percentage is highest, at 65 percent, among women who have 12 or more years of schooling. Women's knowledge and use of microcredit programmes is limited. Fifty-two percent of women know of a microcredit programme in the area and only 5 percent have ever taken a loan from a microcredit programme.

Only 34 percent of women are allowed to go by themselves to all three of the following places: the market, a health facility, and places outside the village/community. The only group of women in which half are allowed to go to all three places alone is women age 40-49.

Ownership of assets

Twenty-six percent of women and 55 percent of men own a house alone or jointly with someone else, and 20 percent of women and 43 percent of men own land alone or jointly with someone else. Ownership of both a house and land is more common in rural than urban areas for both women and men.

Twenty-six percent of women own a house alone or jointly with someone else, and 20 percent of women own land alone or jointly with someone else.

Only 31 percent of women have a mobile phone that they themselves use, and among women who have a mobile phone that they themselves use, three in four (75%) can read SMS messages. Fifty-five percent of urban women have a mobile phone they themselves can use, compared with 23 percent of rural women. The proportion of women with a mobile phone that they use increases dramatically with schooling, from only 12 percent of those with no schooling to 68 percent of those with 12 or more years of schooling.

Less than one-third of women have a mobile phone that they themselves use.

Gender-role attitudes

_ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _

Forty-two percent of women believe it is justifiable for a husband to beat his wife under some circumstances. Women are most likely to believe that wife-beating is justified if a woman shows disrespect for her in-laws (31%), followed by if she argues with her husband (18%) and if he suspects her of being unfaithful (17%). Men are about equally likely to agree: 40 percent say that wife-beating is justified in some circumstances, especially if the wife shows disrespect for in-laws (28%) or if the husband suspects his wife is unfaithful (26%). Even among women and men who have completed at least 12 years of schooling, about one in three (32% of women and men) say that a husband is justified in beating his wife for one or more of the specified reasons.

Eighty-four percent of women and 82 percent of men believe that a woman is justified in refusing to have sex with her husband if she knows he has a sexually transmitted disease, if she knows he has intercourse with other women, and if she is tired or not in the mood. Most men, 79 percent, do not agree that if a wife refuses to have sex with her husband he has a right to get angry and reprimand her, refuse to give her financial support, use force to have sex even if she doesn't want to, or have sex with another woman.

DOMESTIC VIOLENCE

Among women age 15-49, 34 percent have ever experienced physical violence and 6 percent have ever experienced sexual violence. In all, 35 percent of women in Chhattisgarh have experienced physical or sexual violence. Among those who experienced physical violence since age 15, the most common perpetrator for ever-married women was the husband and for never-married women, it was a sister/brother, mother/step-mother, father/step-father, and teacher.

More than one-third of women age 15-49 (35%) in Chhattisgarh have experienced physical or sexual violence.

Violence during pregnancy

One in 20 women who have ever been pregnant have ever experienced physical violence during one or more of their pregnancies. Women who are widowed, divorced, separated, or deserted (11%), women with no schooling (7%), and women belonging to scheduled tribes (7%), are more likely than women in other groups to have experienced violence during pregnancy.

Spousal violence

Nearly one-third (32%) of ever-married women report having been slapped by their husband; 8-15 percent report being pushed, shaken, or having something thrown at them; having their arm twisted or hair pulled; being punched; or being kicked, dragged, or beaten up; and 1-2 percent have experienced being choked or burned on purpose and being threatened or attacked with a knife, gun, or any other weapon. Five percent report that their husbands have physically forced them to have sex even when they did not want to and 4 percent report that their husband forced them with threats or other ways to perform sexual acts they did not want to perform.

Overall, 37 percent of ever-married women have experienced spousal physical or sexual violence from their current husband or, if not currently married, from their most recent husband. Fifteen percent report spousal emotional violence. Few ever-married women (4%) have ever initiated violence against their husband.

Although the prevalence of spousal violence is lower among more educated women, more than 1 in 5 women who have at least 12 years of schooling have experienced physical or sexual spousal violence. The contextual and intergenerational aspects of spousal violence are clear from the fact that women whose mothers were beaten by their fathers are one and a half times more likely to be in abusive marriages themselves. Women whose husbands consume alcohol are much more likely than

women whose husbands do not consume alcohol to experience spousal violence, especially if the husband often gets drunk. However, 24 percent of even women whose husbands do not drink alcohol have experienced physical or sexual spousal violence.

More than one-fourth of women who have experienced spousal physical or sexual violence have suffered injuries as a result of the violence, and among women who have experienced both physical and sexual violence this proportion rises to over 50 percent. The most common type of injury is cuts, bruises, or aches.

Help seeking

Only 21 percent of women who have ever experienced physical or sexual violence by anyone have sought help. Over 70 percent of women have neither sought help nor told anyone about the violence. A large majority (72%) of abused women who have sought help sought it from their own families. One percent of abused women who sought help sought it from the police.

Table 1 Results of the household and individual interviews

Number of households, number of interviews with women and men, and response rates, according to residence, Chhattisgarh, 2015-16 $\,$

| | Resi | dence | _ |
|---|-------|--------|--------|
| Result | Urban | Rural | Total |
| Household interviews | | | |

na = Not applicable

¹ Nuclear households are households comprised of a married couple or a man or a woman living alone or with unmarried ² Protected dug well, protected spring, rainwater, community RO plant
 ³ Surface water, unprotected dug well, unprotected spring, cart with small tank, tanker truck, bottled water
 ⁴ Total may add to more than 100.0 because households may use more than one method of purification
 ⁵ Appropriate water treatment methods include boiling, bleaching, filtering, and electronic purifying
 ⁶ Includes ventilated improved pit (VIP)/biogas latrine and twin pit/composting toilet
 ⁷ Ecolifies that much he accidence in the truck here are the production by the or more hereaded.

⁷ Facilities that would be considered improved if they were not shared by two or more households

⁸ Includes dry toilet

⁹ Houses made from mud, thatch, or other low-quality materials are called *kachha* houses, houses that use partly low-quality and partly high-quality materials are called semi-pucca houses, and houses made with high quality materials throughout, including the floor, roof, and exterior walls, are called *pucca* houses.

Electricity, LPG/natural gas, or biogas

¹¹ Includes coal/lignite, charcoal, wood, straw/shrubs/grass, agricultural crop waste, and dung cakes

¹² Frequency of smoking by anyone inside the house

Table 5 Household possessions and land ownership

Percentage of urban, rural, and total households and de jure population possessing various household goods, means of transport, agricultural land, a house and farm animals and having a bank/post office account, health scheme/health insurance, a BPL card, and a long-lasting insecticide-treated (LLIN) mosquito net, Chhattisgarh, 2015-16

| Number of users | 8,471 | 117 | 297 | 276 | 776 | 9,943 |

Note: All information in this table is based on women's reports. Table includes all users of modern contraceptive methods regardless of their marital status. All modern methods includes users of injectables, which is not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device AYUSH = Ayurveda, yoga and naturopathy, unani, siddha and homeopathy; UHC = Urban health centre; UHP = Urban health post; UFWC = Urban family welfare centre; CHC = Community health centre; PHC = Primary health centre; ANM = Auxiliary nurse midwife; ICDS = Integrated Child Development Services; ASHA = Accredited Social Health Activist; NGO = Nongovernmental organization ¹ Excludes standard days method, lactational amenorrhoea method (LAM), and "other" modern methods

Percentage not shown; based on fewer than 25 unweighted cases

Table 26 Informed choice

Among women who are current users of selected modern contraceptive methods who started the last episode of use within the five years preceding the survey, the percentage who were informed about possible side effects or problems of that method, the percentage who were informed about what to do if they experienced side effects, and the percentage who were ever told by a health or family planning worker about other methods of family planning they could use, by method, according to residence, Chhattisgarh, 2015-16

| Method | Percentage who were informed about possible side effects or problems of method used | Percentage who were informed about what to do if they experienced side effects | Percentage who were ever told by a health or family planning worker of other methods that could be used | Number of women |
|---|---|---|--|---------------------|

| Other ⁶ | 3.3 | 17.8 | 12.0 | 3.4 | 11.2 | 2.2 | 4.6 | 54.6 | 11.5 | 517 |
| All modern spacing methods ⁷ | 2.6 | 21.4 | 6.0 | 8.6 | 3.4 | 4.1 | 5.7 | 51.7 | 3.8 | 2,655 |
| All spacing methods ⁸ | 2.8 | 19.9 | 6.9 | 6.8 | 4.3 | 3.5 | 5.3 | 49.5 | 4.7 | 3,465 |
| All methods | 1.8 | 12.6 | 4.4 | 4.3 | 2.8 | 2.2 | 3.4 | 31.6 | 3.0 | 5,356 |

Note: Figures are based on life table calculations using information on episodes of contraceptive use that began 3-62 months preceding the survey. All methods includes male sterilization, which is not shown separately.

IUD = Intrauterine device; PPIUD = Postpartum intrauterine device

All methods includes male sterilization, which is not shown separately.

² Includes infrequent sex/husband away, difficult to get pregnant/menopausal, and marital dissolution/separation
² Includes lack of access/too far, costs too much, and inconvenient to use

³ Reasons for discontinuation are mutually exclusive and add to the total in this column

The episodes of use included in this column are a subset of the discontinued episodes included in the discontinuation rate. A woman is considered to have switched to another method if she used a different method in the month following discontinuation or if she gave "wanted a more ⁵ Number of episodes of use includes both episodes of use that were discontinued during the period of observation and episodes of use that were

not discontinued during the period of observation ⁶ Includes injectables, female condom, diaphragm, foam/jelly, standard days method, LAM, withdrawal, rhythm, and other modern and traditional

methods that are not shown separately

Includes other modern spacing methods that are not shown separately

⁸ Includes other spacing methods that are not shown separately

Table 28 Men's contraception-related perceptions and knowledge

Percentage of men age 15-49 who agree with two specific statements about women and contraception, and percent distribution of men according to their belief about the efficacy of condoms in preventing pregnancy, by background characteristics, Chhattisgarh, 2015-16

| | Percentage of r | nen who agree | | | who say tha t protects ag | | | |

Note: Numbers in this table correspond to the revised definition of unmet need described in Bradley et al., 2012, Revising Unmet Need for Family Planning, DHS Analytical Studies No. 25, ICF International, Calverton, Maryland, USA. Unmet need for family planning refers to fecund women who are not using contraception but who wish to postpone the next birth (spacing) or stop childbearing altogether (limiting). Specifically, women are considered to have unmet need for spacing if they are: at risk of becoming pregnant, not using contraception, and either do not want to become pregnant within the next two years, or are unsure if or when they want to become pregnant; pregnant with a mistimed pregnancy; postpartum amenorrhoeic for up to two years following a mistimed birth and not using contraception. Women are considered to have unmet need for limiting if they are: at risk of becoming pregnant, not using contraception, and want no (more) children; pregnant with an unwanted pregnancy; postpartum amenorrhoeic for up to two years following a mistimed birth and not using contraception. Women are classified as infecund have no unmet need because they are not at risk of becoming pregnant. Unmet need for family planning is the sum of unmet need for spacing and unmet need for limiting.

Table 31 Pregnancy outcome

Percent distribution of last pregnancies among women age 15-49 during the five years preceding the survey by pregnancy outcome, according to background characteristics, Chhattisgarh, 2015-16

Table 44 Delivery and postnatal care—Continued

Percent distribution of live births in the five years preceding the survey by place of delivery and assistance during delivery, percentage delivered by a skilled provider and bycaesarean section, percentage distribution of live births delivered at home that were delivered by a skilled provider and percentage for which the delivery protocol was followed, and percent distribution of women giving birth in the five years preceding the survey by timing and type of provider of the first postnatal check of the mother for their most recent live birth, by residence, Chhattisgarh, 2015-16

| Delivery and postnatal care descriptors | Urban | Rural | Total |
|---|-------|-------|-------|
| Type of provider of mother's first postnatal check ⁶ | | | |
| Doctor | 42.0 | 20.4 | 25.2 |
| ANM/nurse/midwife/LHV | 35.4 | 44.1 | 42.2 |
| Other health personnel | 0.2 | 0.4 | 0.4 |
| Dai (TBA) | 1.5 | 3.1 | 2.7 |
| Other | 1.2 | 4.9 | 4.1 |
| No postnatal check | 19.7 | 27.0 | 25.4 |
| Total | 100.0 | 100.0 | 100.0 |
| Number of last live births | 1,508 | 5,293 | 6,801 |

NGO = Nongovernmental organization; ANM = Auxiliary nurse midwife; LHV = Lady health visitor; TBA = Traditional birth attendant

Includes missing

² If the respondent mentioned more than one person attending during delivery, only the most qualified person is considered in this table

³Skilled provider includes doctor, auxiliary nurse midwife, nurse, midwife, lady health visitor, and other health personnel A caesarean section for which the decision to have the operation was made after the onset of labour

 ⁵ Based on the last live birth in the five years preceding the survey
 ⁶ Based on the last live birth in the five years preceding the survey. Postnatal checks are checks on the woman's health within 42 days of the birth

Table 45 Delivery and postnatal care by background characteristics

Percentage of live births in the five years preceding the survey delivered in a health facility and percentage delivered with assistance from health personnel, and percentage of women who had a live birth in the five years preceding the survey who received a postnatal check and who received a postnatal check within two days of birth for their most recent birth, by background characteristics, Chhattisgarh, 2015-16

| Background characteristic | Percentage of births delivered in a public health facility | Percentage of births delivered in a private health facility | Percentage of births delivered in a health facility | Percentage of deliveries assisted by health personnel ¹ | Number of births | Percentage of women with a postnatal check ^{2,3} | Percentage of women with a postnatal check within two days of birth ^{2,3} | Number of women |

Note: Total includes information on births to women delivered in an "other" place of delivery and births whose caste/tribe is not known, which are not shown separately. ¹ Includes newborns who received a health check after the first week ² Includes nongovernmental organizations or trust hospitals/clinics () Based on 25-49 unweighted cases

Table 50 Trends in maternal care indicators

Maternal care indicators for births during the three years preceding the survey by residence, NFHS-4 and NFHS-3, Chhattisgarh

| Indicator | NFHS-4 (2015-16) | NFHS-3 (2005-06) |
|---|--|--|
| URBAN | | |
| Percentage who received antenatal care ¹ Percentage who had at least four antenatal care visits ¹ Percentage who received antenatal care within the first trimester of pregnancy ¹ Percentage who received full antenatal care ^{1,2} Percentage of births delivered in a health facility ³ Percentage of deliveries assisted by health personnel ^{3,4} | 98.6 71.2 82.8 29.4 85.6 91.0 | 96.7 60.3 67.5 16.3 58.0 74.0 |
| RURAL | | |
| Percentage who received antenatal care ¹ Percentage who had at least four antenatal care visits ¹ Percentage who received antenatal care within the first trimester of pregnancy ¹ Percentage who received full antenatal care ^{1,2} Percentage of births delivered in a health facility ³ Percentage of deliveries assisted by health personnel ^{3,4} | 95.3 57.0 68.1 20.1 72.3 79.3 | 87.4 22.8 43.5 3.8 7.6 38.5 |
| TOTAL | | |
| Percentage who received antenatal care ¹ Percentage who had at least four antenatal care visits ¹ Percentage who received antenatal care within the first trimester of pregnancy ¹ Percentage who received full antenatal care ^{1,2} Percentage of births delivered in a health facility ³ Percentage of deliveries assisted by health personnel ^{3,4} | 96.0 59.9 71.1 22.1 75.0 81.7 | 88.9 29.1 47.5 5.9 15.8 44.2 |

¹ Based on the last birth to women in the three years preceding the survey
 ² Full antenatal care includes having received at least four antenatal care visits, having received at least one tetanus toxoid (TT) injection and having taken iron and folic acid (IFA) tablets or syrup for 100 or more days
 ³ Based on all births in the three years preceding the survey
 ⁴ Doctor, auxiliary nurse midwife (ANM), nurse, midwife, lady health visitor (LHV), or other health personnel

Table 51 Male involvement in maternal care: Men's report

Among men age 15-49 whose youngest living child was age 0-35 months, percentage for whom the youngest child's mother received antenatal care, percentage who were present for at least one antenatal check-up, percentage who were told by a health provider or worker at any time during the pregnancy about specific signs of pregnancy complications, percentage to whom a health provider or worker spoke about specific aspects of maternal care at any time during the pregnancy, and percentage whose youngest child was delivered in a health facility, and among men with a child age 0-35 months whose youngest living child was not delivered in a health facility, percentage who were given specific home delivery related information, by residence, Chhattisgarh, 2015-16

| Antenatal and delivery care information | Urban | Rural | Total |
|--|--------|-------|-------|
| Percentage of men for whom the youngest child's mother received antenatal care | 98.1 | 89.5 | 91.4 |
| Percentage of men who were present at any antenatal check-up | 89.0 | 73.3 | 76.9 |
| Percentage who were told by a health provider or worker about the following | | | |
| signs of pregnancy complications: | | | |
| Vaginal bleeding | 53.8 | 44.3 | 46.4 |
| Convulsions | 57.0 | 48.4 | 50.3 |
| Prolonged labour | 68.2 | 58.1 | 60.4 |
| Severe abdominal pain | 71.3 | 63.0 | 64.9 |
| High blood pressure | 68.4 | 55.3 | 58.3 |
| Percentage ever told what to do if the mother had any pregnancy complications | 65.3 | 57.6 | 59.4 |
| Percentage whose youngest child age 0-35 months was delivered in a health facility | 82.7 | 73.2 | 75.4 |
| Percentage to whom a health provider or worker spoke about the following aspects of maternal care: | | | |
| The importance of delivering in a health facility | 86.3 | 73.4 | 76.3 |
| The importance of proper nutrition for the mother during pregnancy | 90.3 | 75.8 | 79.1 |
| Family planning or delaying his next child | 78.0 | 67.4 | 69.8 |
| Number of men with a youngest child age 0-35 months | 191 | 648 | 838 |
| Among men whose last child age 0-35 months was not delivered in a health facility, percentage who were told the importance of: | | | |
| Cord care | (58.5) | 48.5 | 50.1 |
| Breastfeeding the baby immediately after delivery | (76.7) | 58.4 | 61.3 |
| Keeping the baby warm immediately after birth | (44.4) | 52.8 | 51.5 |
| Number of men whose youngest child age 0-35 months was not delivered in a health acility | 33 | 174 | 207 |

² Includes children who are below -3 standard deviations (SD) from the WHO Growth Standards population median ³ Excludes children whose mothers were not interviewed ⁴ First born twins (triplets, etc.) are counted as first births because they do not have a previous birth interval ⁶ For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule. ⁷ Excludes children whose mothers were not weighed and measured, children whose mothers are not listed in the household schedule. ⁷ Excludes children whose mothers were not weighed and measured, children whose mothers are pregnant or gave birth within the preceding 2 months. Mother's nutritional status in terms of BMI (Body Mass Index) is presented in Table 70.

Table 61 Initial breastfeeding

Among last-born children who were born in the two years preceding the survey, the percentage who were ever breastfed, and the percentage who started breastfeeding within one hour and one day of birth, and among last-born children born in the two years preceding the survey who were ever breastfed, the percentage who received a prelacteal feed, by background characteristics, Chhattisgarh, 2015-16

Note: Table is based on last-born children born in the past two years whether the children are living or dead at the time of interview. Total includes children belonging to "other" religions, children whose caste/tribe is not known, and children who were delivered in an "other" place of delivery, who are not shown separately.

TBA = Traditional birth attendant

¹ Includes children who started breastfeeding immediately after birth
 ² Includes children who started breastfeeding within one hour of birth
 ³ Children given something other than breast milk during the first three days of life
 ⁴ Doctor, nurse, midwife, auxiliary nurse midwife, lady health visitor, or other health personnel

Table 65 Prevalence of anaemia in children—Continued

Percentage of children age 6-59 months classified as having anaemia, by background characteristics, Chhattisgarh, 2015-16 and total for NFHS-3

| | Anaemia | status by haemogl | obin level | _ | |
|-----------------------------------|--------------------------|----------------------------|-----------------------|-----------------------------|-----------------------|
| Background characteristic | Mild (10.0-10.9 g/dl) | Moderate (7.0-9.9 g/dl) | Severe (<7.0 g/dl) | Any anaemia (<11.0 g/dl) | Number of children |
| Child's living arrangements | | | | | |
| Living with both parents | 24.0 | 17.1 | 0.7 | 41.8 | 6,668 |
| Living with one or neither parent | 24.0 | 15.4 | 0.3 | 39.6 | 715 |
| Mother's anaemia status⁴ | | | | | |
| Not anaemic | 20.0 | 11.4 | 0.6 | 32.0 | 3,512 |
| Mildly anaemic | 27.9 | 19.7 | 0.6 | 48.3 | 2,899 |
| Moderately/severely anaemic | 26.6 | 33.0 | 1.1 | 60.7 | 745 |
| Total | 24.0 | 17.0 | 0.6 | 41.6 | 7,384 |
| NFHS-3 (2005-06) | 24.0 | 45.2 | 2.0 | 71.2 | 1,349 |

Note: Table is based on children who stayed in the household the night before the interview. Prevalence of anaemia, based on haemoglobin levels, is adjusted for altitude using the CDC formula (Centers for Disease Control (CDC). 1998. Recommendations to prevent and control iron deficiency in the United States. *Morbidity and Mortality Weekly Report* 47 (RR-3): 1-29). Haemoglobin levels shown in grams per decilitre (g/dl). Total includes children whose caste/tribe is not known, who are not shown separately.

Excludes children whose mothers were not interviewed

² For women who are not interviewed, information is taken from the Household Questionnaire. Excludes children whose mothers are not listed in the household schedule.

Includes children whose mothers are deceased

⁴ Mildly anaemic is classified as 10.0-11.9 g/dl for non-pregnant women and 10.0-10.9 g/dl for pregnant women. Moderately/severely anaemic is <10.0 g/dl. Adjusted for altitude and for smoking status. Excludes children whose mother's anaemia status is not known. () Based on 25-49 unweighted cases

Percentage of ever-married women age 15-49 who have experienced various forms of violence committed by their husband ever and in the 12 months preceding the survey, Chhattisgarh, 2015-16

| | | In | the past 12 mo | nths |
|--|-------------------|-------|----------------|-----------------------|
| Type of violence | Ever ¹ | Often | Sometimes | Often or sometimes |
| Physical violence | | | | |
| Any form of physical violence | 36.3 | 3.2 | 23.2 | 26.4 |
| Pushed her, shook her, or threw something at her | 14.8 | 1.3 | 8.6 | 9.9 |
| Twisted her arm or pulled her hair | 13.2 | 0.9 | 8.5 | 9.4 |
| Slapped her | 32.0 | 2.2 | 20.3 | 22.5 |
| Punched her with his fist or with something that could hurt her | 8.7 | 0.8 | 4.6 | 5.3 |
| Kicked her, dragged her, or beat her up | 8.3 | 0.7 | 4.7 | 5.5 |
| Tried to choke her or burn her on purpose Threatened her or attacked her with a knife, gun, or any other | 1.6 | 0.3 | 0.9 | 1.2 |
| weapon | 0.8 | 0.1 | 0.4 | 0.4 |
| Sexual violence | | | | |
| Any form of sexual violence Physically forced her to have sexual intercourse with him even when | 6.6 | 0.7 | 4.4 | 5.1 |
| she did not want to | 5.4 | 0.6 | 3.3 | 4.0 |
| Physically forced her to perform any sexual acts she did not want to Forced her with threats or in any other way to perform sexual acts she | 2.5 | 0.4 | 1.6 | 2.0 |
| did not want to | 3.9 | 0.4 | 2.6 | 3.0 |
| Emotional violence | | | | |
| Any form of emotional violence | 15.2 | 1.8 | 10.0 | 11.8 |
| Said or did something to humiliate her in front of others | 9.2 | 1.0 | 5.8 | 6.8 |
| Threatened to hurt or harm her or someone close to her | 5.9 | 0.6 | 3.5 | 4.1 |
| Insulted her or made her feel bad about herself | 10.2 | 1.1 | 7.2 | 8.3 |
| Any form of physical and/or sexual violence | 36.7 | 3.5 | 24.0 | 27.5 |
| Any form of physical and sexual violence | 6.2 | 0.4 | 3.6 | 4.0 |
| Any form of physical and/or sexual and/or emotional violence | 38.3 | 4.2 | 25.4 | 29.6 |
| Any form of physical and sexual and emotional violence | 4.0 | 0.2 | 2.6 | 2.8 |
| Any violence by women against their husband ² | 3.5 | 0.2 | 2.6 | 2.8 |
| Number of ever-married women | 1,926 | 1,926 | 1,926 | 1,926 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.

¹ Includes in the past 12 months
 ² Any violence by women against their husband when he was not already beating or physically hurting her

Table 98 Spousal violence by background characteristics

Percentage of ever-married women age 15-49 who have everexperienced emotional, physical, or sexual violence committed by their husband, according to background characteristics, Chhattisgarh, 2015-16

| Background characteristic | Emotional violence | Physical violence | Sexual violence | Physical or sexual violence | Emotional, physical, or sexual violence | Number of women |
|-------------------------------------|--------------------|-------------------|--------------------|-----------------------------------|--|--------------------|
| Age | | | | | | |
| 15-19 | (25.3) | (22.2) | (5.1) | (24.4) | (29.3) | 38 |
| 20-24 | 11.7 | 29.0 | 6.0 | 29.8 | 31.4 | 281 |
| 25-29 | 12.2 | 34.1 | 7.8 | 34.6 | 37.0 | 429 |
| 30-39 | 16.0 | 39.1 | 5.8 | 39.5 | 41.1 | 616 |
| 40-49 | 17.7 | 39.5 | 7.0 | 39.5 | 40.4 | 563 |
| Residence | | | | | | |
| Urban | 12.6 | 34.9 | 7.2 | 35.4 | 36.7 | 482 |
| Rural | 16.1 | 36.8 | 6.4 | 37.1 | 38.8 | 1,444 |
| Schooling | | | | | | |
| No schooling | 21.6 | 43.4 | 7.9 | 43.7 | 45.3 | 716 |
| <5 years complete | 13.1 | 37.7 | 5.6 | 37.8 | 40.6 | 154 |
| 5-9 years complete | 13.0 | 37.4 | 6.4 | 38.0 | 39.2 | 667 |
| 10-11 years complete | 7.7 | 24.5 | 8.8 | 25.5 | 27.3 | 113 |
| 12 or more years complete | 8.2 | 19.2 | 3.4 | 19.5 | 21.2 | 275 |
| Employment (past 12 months) | | | | | | |
| Not employed | 12.2 | 30.5 | 4.8 | 30.9 | 32.4 | 930 |
| Employed for cash | 18.9 | 42.8 | 8.5 | 43.3 | 45.1 | 822 |
| Employed not for cash | 13.8 | 36.8 | 7.2 | 36.8 | 37.7 | 174 |
| Marital status | | | | | | |
| Currently married | 14.0 | 35.8 | 5.9 | 36.2 | 37.8 | 1,809 |
| Widowed | 11.4 | 26.6 | 3.5 | 26.6 | 27.6 | 65 |

| Sometimes | 13.3 | 36.7 | 5.3 | 37.3 | 38.9 | 1,264 |
| Never | 8.6 | 23.8 | 3.8 | 23.8 | 26.0 | 475 |
| Total | 15.2 | 36.3 | 6.6 | 36.7 | 38.3 | 1,926 |

Note: Husband refers to the current husband for currently married women and the most recent husband for widowed, divorced, separated, or deserted women.

¹ Currently married women only

² Behaviours include: Is jealous or angry if she talks to other men, frequently accuses her of being unfaithful, does not permit her to meet her

female friends, tries to limit her contact with her family, insists on knowing where she is at all times, and does not trust her with any money ³ Currently married women only. Decisions included are decisions about own health care, major household purchases, and visits to her family or relatives.

relatives. ⁴ Reasons given for which wife beating is justified include: she goes out without telling him, she neglects the house or children, she argues with him, she refuses to have sexual intercourse with him, she doesn't cook properly, he suspects she is unfaithful, and she shows disrespect for in-laws

⁵ Reasons given for refusing to have sexual intercourse with husband include: she knows her husband has a sexually transmitted disease, she knows her husband has sex with other women, and she is tired or not in the mood

() Based on 25-49 unweighted cases

Table 100 Injuries to women due to spousal violence

Percentage of ever-married women age 15-49 who have experienced spousal violence by types of injuries resulting from what their husband did to them, the type of violence, and whether they have experienced the violence ever and in the 12 months preceding the survey, Chhattisgarh, 2015-16

| | | Percen | tage of women wh | no have had: | | _ |
|--|----------------------------|-----------------|--|--|--------------------------|------------------------------------|
| Type of spousal violence experienced | Cuts, bruises, or aches | Severe burns | Eye injuries, sprains, dislocations, or minor burns | Deep wounds, broken bones, broken teeth, or any other serious injury | Any of these injuries | Number of ever-married women |
| Experienced physical violence ¹ | | | | | | |
| Experienced physical violence | 23.3 | 0.9 | 7.0 | 5.0 | 26.6 | 699 |
| | 23.3 | 0.9 1.2 | 6.5 | 5.5 | 26.5 | 509 |
| In the past 12 months | 22.0 | 1.2 | 0.5 | 5.5 | 20.5 | 509 |

 Percentage not shown; based on fewer than 25 unweighted cases

APPENDIX

ESTIMATES OF SAMPLING ERRORS

The estimates from a sample survey are affected by two types of errors: (1) non-sampling errors, and (2) sampling errors. Non-sampling errors are the results of mistakes made in implementing data collection and data processing, such as failure to locate and interview the correct household, misunderstanding of the questions on the part of either the interviewer or the respondent, and data entry errors. Although numerous efforts were made during the implementation of the fourth National Family Health Survey (NFHS-4) to minimize this type of error, non-sampling errors are impossible to avoid and difficult to evaluate statistically.

Sampling errors, on the other hand, can be evaluated statistically. The sample of respondents selected in NFHS-4 is only one of many samples that could have been selected from the same population, using the same design and expected sample size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability among all possible samples. Although the degree of variability is not known exactly, it can be estimated from the survey results.

A sampling error is usually measured in terms of the standard error for a particular statistic (mean, percentage, etc.), which is the square root of the variance. The standard error can be used to calculate confidence intervals within which the true value for the population can reasonably be assumed to fall. For example, for any given statistic calculated from a sample survey, the value of that statistic will fall within a range of plus or minus two times the standard error of that statistic in 95 percent of all possible samples of identical size and design.

If the sample of respondents had been selected as a simple random sample, it would have been possible to use straightforward formulas for calculating sampling errors. However, the NFHS-4 sample is the result of a multi-stage stratified design, and, consequently, it was necessary to use more complex formulae. The computer software used to calculate sampling errors for NFHS-4 is programmed in SAS. This procedure uses the Taylor linearization method for variance estimation for survey estimates that are means or proportions. The Jackknife repeated replication method is used for variance estimation of more complex statistics such as total fertility rates and child mortality rates.

The Taylor linearization method treats any proportion or mean as a ratio estimate, r = y/x, where y represents the total sample value for variable y, and x represents the total number of cases in the group or subgroup under consideration. The variance of r is computed using the formula given below, with the standard error being the square root of the variance:

$$SE^{2}(r) = var(r) = \frac{1-f}{x^{2}} \sum_{h=1}^{H} \left[\frac{m_{h}}{m_{h}-1} \left(\sum_{i=1}^{m_{h}} z_{hi}^{2} - \frac{z_{h}^{2}}{m_{h}} \right) \right]$$

in which

$$z_{hi} = y_{hi} - rx_{hi}$$
, and $z_h = y_h - rx_h$

where h represents the stratum, which varies from 1 to H,

 m_h is the total number of clusters selected in the h^{th} stratum,

- y_{hi} is the sum of the weighted values of variable y in the i^{th} cluster in the h^{th} stratum,
- x_{hi} is the sum of the weighted number of cases in the i^{th} cluster in the h^{th} stratum, and
- *f* is the overall sampling fraction, which is so small that it is ignored.

The Jackknife repeated replication method derives estimates of complex rates from each of several replications of the parent sample, and calculates standard errors for these estimates using simple formulae. Each replication considers all but one cluster in the calculation of the estimates. Pseudo-independent replications are thus created. In the NFHS-4 sample for Chhattisgarh, there were 946 clusters. Hence, 946 replications were created. The variance of a rate r is calculated as follows:

$$SE^{2}(r) = var(r) = \frac{1}{k(k-1)} \sum_{i=1}^{k} (r_{i} - r)^{2}$$

in which

$$r_i = kr - (k-1)r_{(i)}$$

where *r* is the estimate computed from the full sample of 946 clusters,

- $r_{(i)}$ is the estimate computed from the reduced sample of 945 clusters (*i*th cluster excluded), and
- *k* is the total number of clusters.

In addition to the standard error, the design effect (DEFT) for each estimate is also computed, which is defined as the ratio between the standard error using the given sample design and the standard error that would result if a simple random sample had been used. A DEFT value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates the increase in the sampling error due to the use of a more complex and less statistically efficient design. The relative standard error (SE/R) and confidence limits (R±2SE) for each estimate are also computed.

Sampling errors for NFHS-4 are calculated for selected variables considered to be of primary interest. The results are presented in this appendix for Chhattisgarh as a whole and for the urban and rural areas of the state. For each variable, the type of statistic (mean, proportion, rate, or ratio) and the base population are given in Table A.1. Table A.2 presents the value of the statistic (R), its standard error (SE), the number of unweighted (N) and weighted (WN) cases, the design effect (DEFT), the relative standard error (SE/R), and the 95 percent confidence limits (R±2SE); for each variable. The DEFT is considered undefined when the standard error for a simple random sample is zero (when the estimate is close to 0 or 1).

| Variable | Estimate | Base population |
|--|--------------------------|--|
| valiaมเซ | | Base population |
| | HOUSEHO | LDS |
| Using an improved source of drinking water | Proportion | Households |
| Using an improved sanitation facility | Proportion | Households |
| Using iodized salt | Proportion | Households |
| Sex ratio (females per 1,000 males) | Ratio | De facto household population, all ages |
| | WOMEN | l |
| No schooling (Females age 6 years and above) | Proportion | De facto household population of females age 6 and above |
| Urban residence | Proportion | Women age 15-49 |
| No schooling (Women age 15-49) | Proportion | Women age 15-49 |
| Completed 10 or more years of schooling | Proportion | Women age 15-49 |
| Never married, including married gauna not performed | Proportion | Women age 15-49 |
| Currently married | Proportion | Women age 15-49 |
| Married before age 18 | Proportion | Women age 20-49 |
| Currently using any contraceptive method | Proportion | Currently married women age 15-49 |
| Currently using a modern contraceptive method | Proportion | Currently married women age 15-49 |
| Currently using a traditional contraceptive method | Proportion | Currently married women age 15-49 |
| Currently using pill | Proportion | Currently married women age 15-49 |
| Currently using IUD/PPIUD | Proportion | Currently married women age 15-49 |
| Currently using condom/ <i>Nirodh</i> | Proportion | Currently married women age 15-49 |
| Currently using female sterilization | Proportion | Currently married women age 15-49 |
| Using public medical sector source of contraception | Proportion | Women age 15-49 currently using modern methods of contraception |
| Unmet need for family planning Want no more children | Proportion | Currently married women age 15-49 Currently married women age 15-49 |
| Want to delay next birth at least 2 years | Proportion Proportion | Currently married women age 15-49 Currently married women age 15-49 |
| Mother received four or more antenatal care (ANC) visits | Proportion | Women with at least one birth in last five years (last birth) |
| Took iron and folic acid (IFA) for 100 days or more | Proportion | Women with at least one birth in last five years (last birth) Women with at least one birth in last five years (last birth) |
| Birth registration | Proportion | De jure children under age 5 years |
| Births delivered by a health personnel | Proportion | Births in last 5 years |
| Institutional delivery | Proportion | Births in last 5 years |
| Postnatal check for mother within 2 days of birth | Proportion | Women with at least one birth in last five years (last birth) |
| Postnatal check for newborn within 2 days of birth | Proportion | Women with at least one birth in last five years (last birth) |
| Exclusive breastfeeding | Proportion | Children under age 6 months |
| Children with diarrhoea | Proportion | Children under age 5 years |
| Treated with oral rehydration salt (ORS) packets | Proportion | Children under age 5 years with diarrhoea in last 2 weeks |
| Children with diarrhoea taken to a health provider | Proportion | Children under age 5 years with diarrhoea in last 2 weeks |
| Child received BCG vaccination | Proportion | Children age 12-23 months |
| Child received DPT vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child received polio vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child received measles vaccination | Proportion | Children age 12-23 months |
| Child received hepatitis B vaccination (3 doses) | Proportion | Children age 12-23 months |
| Child with all basic vaccinations | Proportion | Children age 12-23 months |
| Children given vitamin A supplement in last 6 months | Proportion | Children age 9-59 months |
| Height-for-age, stunting (below -2SD) | Proportion | Children under age 5 years who were measured |
| Weight-for-height, wasting (below -2SD) | Proportion | Children under age 5 years who were measured |
| Weight-for-age, underweight (below -2SD) | Proportion | Children under age 5 years who were measured |
| Children with any anaemia | Proportion | Children age 6-59 months with an anaemia test |
| Women with any anaemia | Proportion | Women age 15-49 with an anaemia test |
| Body mass index (BMI) <18.5 kg/m² Body mass index (BMI) ≥25.0 kg/m² | Proportion Proportion | Women age 15-49 who were measured |
| Have heard of HIV/AIDS | Proportion | Women age 15-49 who were measured Women age 15-49 |
| Have comprehensive knowledge about HIV/AIDS | Proportion | Women age 15-49 Women age 15-49 |
| Ever experienced physical or sexual violence | Proportion | Women age 15-49 |
| Total fertility rate (last 3 years) | Rate | Women |
| Neonatal mortality | Rate | Births in last 5 years |
| Post-neonatal mortality | Rate | Births in last 5 years |
| Infant mortality | Rate | Births in last 5 years |
| Child mortality | Rate | Births in last 5 years |
| Under-five mortality | Rate | Births in last 5 years |
| | MEN | |
| No schooling (Males age 6 years and above) | Proportion | De facto household population of males age 6 and above |
| Urban residence | Proportion | Men age 15-49 |
| No schooling (Men age 15-49) | Proportion | Men age 15-49 Men age 15-49 |
| Completed 10 or more years of schooling | Proportion | Men age 15-49 |
| Never married, including married gauna not performed | Proportion | Men age 15-49 |
| Currently married | Proportion | Men age 15-49 |
| Married before age 21 | Proportion | Men age 25-49 |
| Want no more children | Proportion | Currently married men age 15-49 |
| Want to delay next birth at least 2 years | Proportion | Currently married men age 15-49 |
| Men with any anaemia | Proportion | Men age 15-49 with an anaemia test |
| Body mass index (BMI) <18.5 kg/m ² | Proportion | Men age 15-49 who were measured |
| Body mass index (BMI) ≥25.0 kg/m ² | Proportion | Men age 15-49 who were measured |
| Have heard of HIV/AIDS | Proportion | Men age 15-49 |
| Have comprehensive knowledge about HIV/AIDS | Proportion | Men age 15-49 |
