The 2020 Kenya Malaria Indicator Survey (2020 KMIS) was implemented by the MOH DNMP and the Kenya National Bureau of Statistics (KNBS). Financial support for the survey was provided by the United States Agency for International Development (USAID) through the President’s Malaria Initiative (PMI) and by the Government of Kenya with Global Fund support. ICF provided technical assistance through The DHS Program, a USAID-funded project offering support and technical assistance in the implementation of population and health surveys in countries worldwide.

The contents of this fact sheet are the sole responsibility of DNMP, KNBS, and ICF and do not necessarily reflect the views of USAID, the United States Government, or other donor agencies.

Response Rates and methodology: All children age 6 months to 14 years living in selected households were eligible for malaria and anaemia testing. Malaria testing was done through a rapid diagnostic test (RDT) as well as blood smear microscopy. Anaemia testing was carried out using the HemoCue system. Of the 12,253 eligible children, 94% provided blood for anaemia testing, RDT, and malaria microscopy.
The 2020 Kenya Malaria Indicator Survey (KMIS) provides population-based estimates on malaria indicators including malaria prevention, case management, and prevalence of malaria and anaemia to inform strategic planning and programme evaluation.

*Tnote: The definition of an ITN in surveys prior to 2020 KMIS included nets that had been soaked with insecticides within the past 12 months.
